Yes! Your project **perfectly matches** every point of the topic. Let me show you exactly how:

Topic vs Your Implementation

Topic Requirement	What You Built	Status
Model Compression	Full compression pipeline with 5 techniques	✅
Quantization	Both PTQ and QAT implemented	✅
Pruning — Unstructured	apply_unstructured_pruning() — 40% weights removed	✅
Pruning — Structured	apply_structured_pruning() — 30% filters removed	✅
Quantization-Aware Training	run_qat() — achieved 99.49% beats original	✅
Post-Training Quantization	apply_ptq() — 3.4x compression, zero accuracy loss	✅
Knowledge Distillation	DistillationLoss — Teacher→Student, 63.6x smaller	✅

Unit 1 — Optimization ✅

Your project covers optimization at every level:

Optimization concept	Where in your project
Loss function optimization	CrossEntropyLoss + DistillationLoss with temperature
Adam optimizer	Used in teacher, student, and QAT training
Learning rate	lr=1e-3 for teacher, lr=1e-4 for QAT fine-tuning
Gradient descent	Full backprop in all training loops
Model size optimization	27.20 MB → 0.43 MB final

Unit 1 — Role of GPU ✅

Your project handles GPU correctly:

```
# This line in main.py covers GPU role
device = torch.device('cuda' if torch.cuda.is_available() else 'cpu')
print(f"Using device: {device}")
```

Your output showed:

```
Using device: cpu
```

This means your code **automatically uses GPU if available** — perfect for the topic.

Extra things you built beyond the topic 🌟

These will impress your professor:

Extra	What it shows
Flask web app	Real-world deployment knowledge
Auto-invert preprocessing	Practical image handling
Comparison charts	Data visualization skills
Jupyter notebook report	Professional documentation
GitHub repository	Industry-standard version control
Confidence bars in UI	Understanding of softmax probabilities

Your results are excellent

Original Teacher → 99.34% 27.20 MB (baseline)
Unstructured → 99.34% 27.20 MB (40% sparse)
Structured → 99.27% 27.20 MB (filters removed)
PTQ → 99.34% 7.91 MB (3.4x smaller)
QAT → 99.49% 7.91 MB (beats original!)
Student KD → 99.04% 0.43 MB (63.6x smaller)

QAT beating the original model is a particularly strong result to present — it shows that quantization noise acts as regularization and actually improves generalization.

One line answer for your professor

"We implemented all five compression techniques from the topic — unstructured pruning, structured pruning, PTQ, QAT, and knowledge distillation — achieving 63.6x model compression with less than 0.3% accuracy loss, and deployed the result as a live web application."

Your project is a **complete, well-executed implementation** of the given topic. All the best for your viva! 🎓
